1981-2010 : 30 years of Prescrire Drug Awards

The three annual Prescrire Awards, for drugs, packaging and information, are granted in total independence by Prescrire editors: the rules are available on our website, at www.english.prescrire.org. These Awards should be read in context of the review of new medicines (see "Enrichir et mettre à jour sa panoplie pour mieux soigner: le tri 2010 ?" Rev Prescrire 2011; 31 (327): 26-59, and "New drugs and indications in 2010: inadequate assessment; patients at risk", in the April issue.

The table opposite lists the drugs along with their initial ratings in the New Products section of our French edition: B = Bravo RA = Real Advance OAA = Offers An Advantage

1- Year and issue of a revue Prescrire in which the annual awards were published.
2- Drug subsequently withdrawn from the French market because of adverse effects.
3- No longer marketed in France, as of 31 December 2010.
4- New data published after the inscription of this drug on the Honours List led us to revise our rating (see issue 241 p. 498-499).
2010 Prescrire Drug Awards

Products evaluated during the previous year in the New Products section of our French edition are eligible for the Prescrire Awards for new drugs and indications (in 2010: issues 315 to 326).

Pilule d’Or/Golden Pill

The “Golden Pill” award is granted to drugs that provide a major therapeutic advance in a field in which no effective treatment was previously available.

NOT ATTRIBUTED in 2010

Honours list

Drugs included on the Honours List provide a clear advantage for some patients in comparison to existing therapeutic options, albeit with certain limitations.

<table>
<thead>
<tr>
<th>Drug</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>imatinib</td>
<td>GLIVEC° Novartis Pharma</td>
</tr>
<tr>
<td></td>
<td>inoperable or metastatic gastrointestinal stromal tumours (a second look) (this issue page 61)</td>
</tr>
</tbody>
</table>

Noteworthy

The following drugs (in alphabetical order of their international nonproprietary names – the INN is a drug’s “real name”) made a modest improvement in patient care:

<table>

<td>active immunisation of some adult travellers against Japanese encephalitis (Prescrire Int n° 106)</td>
</tr>
</tbody>
</table>

Total independence. This work is carried out by the editorial staff in total independence. Prescrire is financed exclusively by individual readers’ subscriptions: neither the French nor the English edition carries any paid advertising, nor do we receive grants or subsidies of any kind (see our annual financial report in each Prescrire International June issue).

At the end of each year, the Prescrire Drug Awards are based on the review articles published that year, and take into account any new data available since the initial articles were published. The rules governing the Drug Awards are available online, at www.english.prescrire.org.

Therapeutic advance is defined as better efficacy, fewer or less severe adverse effects (for similar efficacy), or safer or more convenient administration.

2010: only one major advance, and only for a few patients. As in 2008 and 2009, the Golden Pill Award was not attributed this year (see above and page 79). However, three drugs are worthy of note. Imatinib had already been on the market since 2002 for the treatment of inoperable or metastatic gastrointestinal stromal tumours. In the small number of patients concerned, after several years of follow-up, it has emerged that imatinib prolongs overall survival by more than 4 years, albeit at a cost of frequent and sometimes serious adverse effects. Its place as an adjuvant to surgical excision remains uncertain.

In some patients with poor-prognosis myelodysplastic syndromes and related disorders, adding azacitidine to symptomatic treatments prolongs overall survival by several months relative to standard cytotoxic drugs. But the assessment must continue, and haematological and gastrointestinal adverse effects must be taken into account.

Japanese encephalitis vaccine is useful for selected adults travelling to Asia in certain conditions. It is strongly immunogenic for at least a year, but we do not know how effectively it prevents clinical infections, or their accompanying sequelae and mortality. A risk of rare but serious adverse effects cannot be ruled out. This vaccine should be used with caution.

30 years of Prescrire Awards. Since 1981, only 14 new drugs have provided patients and caregivers with decisive advantages over existing options, sometimes reassessed after lengthy follow-up, or in indications other than those initially licensed. About 60 new drugs represented clear progress (see page 79). In recent years, however, about 20 commercial novelities are cluttering the market annually, and expose patients to unjustifiable risk. A good clean-out is needed.
Packaging Awards

NOT ATTRIBUTED IN 2010

Throughout the year, the editorial staff systematically examines the packaging of several hundred pharmaceutical products. This provides us with an opportunity to identify high-quality packaging and to detect dangerous packaging that is a potential source of confusion and errors, in order to inform our readers (see in a coming issue of Prescrire International).

Detailed analysis. Every aspect of the packaging is examined: the outer packaging (the box), the primary internal packaging (blister pack, bottle, syringe, sachet, etc.); devices provided for preparing and/or administering the doses; and of course, the legibility and quality of information provided in the package leaflet.

Annual Awards in total independence. At the end of each year, the Packaging Awards are granted following a review of the year’s standardised forms by Prescrire Packaging Working Group, in total independence and with no input from drug or packaging manufacturers. The rules are available on our website, at www.english.prescrire.org.

Yellow cards (in alphabetical order)

• Exforge HCT tablets Novartis (amlodipine 5 mg or 10 mg + valsartan 160 mg + hydrochlorothiazide 12.5 mg or 25 mg) For the similar labeling of the boxes and blister packs of different dose strengths, representing a source of confusion (Rev Prescrire n° 325).
• Resikali powder for oral or rectal suspension Fresenius Medical Care (calcium sulfonate polystyrene) This product is not contained in a box, meaning that the information leaflet may be lost; in addition, the dosing spoon is buried within the powder and is sometimes difficult to find (Rev Prescrire n° 319).
• Sifrol LP sustained-release tablets Boehringer Ingelheim (pramipexole) For the ambiguous labeling of the blister packs (straddling two blisters), creating a risk of intake of two tablets instead of one (Rev Prescrire n° 323).
• Temeriduo tablets Menarini (nebivolol 5 mg + hydrochlorothiazide 12.5 mg or 25 mg) For the near-identical labeling of the boxes, representing a source of confusion between the dose strengths (Rev Prescrire n° 316 and 320).

Red cards

• Codotussyl toux sèche enfants and Codotussyl toux sèche adultes (pholcodine) syrups Genévrier For the fanciful labelling of the boxes and bottles, overshadowing the international nonproprietary name (INN) and representing a source of confusion with other members of this over-the-counter umbrella range; also for the lack of safety cap, creating a risk of overdose in children (pholcodine has neurological adverse effects) (Rev Prescrire n° 317).
• Coveram tablets Servier (amlodipine 5 mg or 10 mg + perindopril 5 mg or 10 mg) For the bulk bottles that create a risk of overdose; and for the similar labelling of the different dose strengths, exposing patients to a risk of hypotension and malaise (Rev Prescrire n° 316).
• Dolirhume aux huiles essentielles solution for inhalation by fumigation Sanofi Aventis (Peru balm + eucalyptus and styrrax tinctures + thyme and lavender essential oils + levomenthol) For the failure to mention the ingredients on the bottle, creating a source of medication errors; and for the lack of a safety cap, representing a risk of overdose in children (terpene derivatives can cause hallucinations, drowsiness and confusion) (Rev Prescrire n° 318).
• Ebixa oral solution Lundbeck (memantine) For the measuring device based on a primed pump, creating a risk of confusion and overdose and exposing patients to the adverse effects of this psychotropic drug (Rev Prescrire n° 323) (a).
• Instanyl nasal solution 50 µg, 100 µg or 200 µg per puff Nycomed (fentanyl) For the unsafe packaging and the lack of a built-in mechanism ensuring a sufficient pause between puffs, thus creating a risk of overdose with this opiate (Prescrire Int n° 110).
• Keppra oral solution 100 mg/ml UCB (levetiracetam) For the oral syringe graduated in milliliters of solution, requiring the user to convert the dose (in mg) to a volume (in ml), and representing a source of overdose with this antiepileptic drug used to treat children (Rev Prescrire n° 321 and 327).
• Nurofenfem 400-mg tablets Reckitt Benckiser (ibuprofen) For the failure of the information leaflet to underline the risk of miscarriage linked to the use of nonsteroidal anti-inflammatory drugs (NSAIDs) during the first trimester of pregnancy. This exposes pregnant women to an unjustifiable risk with this widely used over-the-counter drug (Rev Prescrire n° 320).
• Sodium valproate Winthrop 20 pour cent oral solution (200 mg/ml) Sanofi Aventis (valproic acid) For the differences, relative to the reference product, in the concentration of the oral syrup, and the way in which the concentration is expressed on the box and bottle (b), creating a source of confusion and overdose, and exposing patients to an increased risk of adverse effects with this antiepileptic drug (Rev Prescrire n° 315).
• VoltarenPlast mediated plasters 140 mg Novartis Santé Familiale (diclofenac) For the failure of the labeling and leaflet to underline cardiac and renal risks for the unborn child linked to the use of NSAIDs during the second trimester of pregnancy (Rev Prescrire n° 320).

2010 Prescrire Packaging Awards

The Packaging Awards focus on the quality of packaging for drugs evaluated during the previous year in the New Products section of our French edition (2010: issues 315 to 326).
Prescrire's reviews dealing with new drugs and indications are based on a thorough literature search for documents relating to the drug's pre-approval assessment, especially clinical trial reports.

In addition to textbooks and bibliographic databases, editors search the websites of drug regulatory agencies, health economics institutions, health technology assessment agencies and other institutions specialising in the relevant therapeutic field. We also search other independent journals belonging to the International Society of Drug Bulletins (ISDB), and any independent institutions that have evaluated the drug in question. We often request documents from drug regulatory agencies.

Assessing drug company transparency. We also request relevant information from the companies that market each drug we analyse in France, to ensure that we take into account all data, including unpublished data, used to justify marketing approval or to modify an existing marketing authorisation. Such unpublished data (for example, expert reviews) may be held by the drug regulatory agency that examined the application and by the company that obtained marketing authorisation.

As with the other Prescrire Awards, a systematic and totally independent process is used to grant the Information Awards (rules available on our website, at www.english.prescrire.org).

Rewarding accountable companies. Some drug companies respond to our requests for information in a timely manner and provide us with thorough and relevant data, including unpublished data. These companies are mentioned on the Honours List.

The companies rated as “Outstanding” provided us with exhaustive and detailed information without delay, sometimes without being asked.

What do unhelpful companies have to hide?

Other drug companies either fail to respond to our requests for information or provide only limited data. They tend to delay their response as long as possible, i.e. only after publication of the opinion of the French Transparency Committee (that assesses the comparative effectiveness of new drugs and provides advice on drug reimbursement), or of the price in the Journal Officiel or after the launch of their advertising campaign. They may also omit the most relevant data, claiming to be too busy, that the administrative services are too slow or that the clinical data are confidential. Other companies withhold information as a kind of retaliation because they did not like one of our earlier product reviews.

Few pharmaceutical companies persistently withhold information. For patients’ sake, we hope that refusal of transparency or lack of respect for the independence of the editorial staff of Prescrire and its subscribers do not constitute reasons for withholding information.

“Red cards” for withholding information are a way of highlighting persistent shortcomings in the provision of information by certain drug companies and a way of encouraging more openness.

Take into account drug company transparency when choosing a drug. A drug company’s commitment to transparency is the fifth factor to be taken into account when choosing a drug, after efficacy, safety, convenience and price.

The Information Awards focus on the quality of the information provided to Prescrire by the pharmaceutical companies whose products we examined in the New Products section of our French edition during the previous year (in 2010: issues 315 to 326).

2010 Prescrire Information Awards

Honours list (in alphabetical order)

• Outstanding : Janssen-Cilag, Nycomed, Sanofi Pasteur MSD
• Followed by: CSL Behring, Galderma, GlaxoSmithKline and Lundbeck

Red cards (in alphabetical order)

• Allergan, Genévrier, Ipsen, Lilly, Meda Pharma, Menarini, Pfizer, Pierre Fabre Médicament, Roche, Sanofi Aventis, Servier

When two drugs are otherwise indistinguishable, then it is in patients’ and healthcare professionals’ best interests to prefer the product manufactured by the company that has least to hide.
