Strengthened pharmacovigilance. The Regulation was amended to oblige companies to set up a risk management system for all paediatric drugs, and not only "*where there is particular cause for concern*" as proposed in the initial draft (article 35). An amendment required that adequate public funding was ensured for pharmacovigilance (article 35). Another amendment required that data on adverse effects collected before and after market release should be gathered together in a publicly accessible registry (article 35).

Missed opportunities

The main deficiencies to the current proposal concern incentives and added therapeutic value.

The same rewards for all… For drug companies and the European Commission, a 6-month patent extension was the cornerstone of the draft Regulation. The Medicines in Europe Forum and concerned European deputies from across the political spectrum failed to ensure that incentives and rewards would be proportional either to added therapeutic value or to true R&D costs.

However, according to an adopted amendment, after a 6-year period the EU Commission "*shall carry out an analysis of the incentive and reward operations (…) with a financial assessment relating to the research costs and profits resulting from such incentives*", which could lead to updating the Regulation (article 49) if the incentives mechanism is found to be ill-suited to children's health needs.

We also welcome the adoption of several amendments designed to avoid the accumulation of both paediatric incentives and other types of protection (article 36 and 37), and rewards for trials already carried out (article 55).

Insufficient attention to therapeutic advantage. The Commission presented the draft Regulation as a response to the lack of development or testing of drugs to ensure that they meet children's health needs (3). The Medicines in Europe Forum considered it logical that, when a drug is already approved for a paediatric indication, any new drugs with the same indication should be compared with it. Unfortunately, amendments intended to ensure such comparative evaluations of paediatric drugs were rejected.

However, the paediatric committee will still have a major role when it comes to establishing the list of waivers regarding the obligation to conduct paediatric studies, and approving drug companies' "*paediatric investigation plans*". The Regulation states that: "*in all its work, the paediatric committee should make sure that studies in children have potential significant therapeutic benefits for paediatric patients*" (3).

The Commission has refused or partly refused some important amendments adopted by the members of Parliament after first reading. The Commission has published a new draft proposal (with a selection of amendments) that has been accepted by the Council of Health Ministers. The new draft will have to go before the Parliament for a second reading in 2006.

The French regulatory agency: where do its true priorities lie?

The French regulatory agency (Afssaps) rarely supports its decisions with solid and precise data. This will soon have to change, when European Directive 2004/27/EC on human medicines is transposed into French law. For the moment, however, the Afssaps director general provides little or no information on the reasons for his decisions.

As a result, the French public can only watch and wonder. In certain cases an intriguing relationship appears to exist between the sales figures of a drug with a negative risk-benefit balance and the time taken to withdraw it from the market. For example, the Agency demanded the market withdrawal of local antibiotics (delivered intranasally or to the oropharynx), but took several years to enforce its decision; bizarrely, the drugs with the most sales were among the last to be withdrawn (see the example of Locabiotal° (fusafungine) (**a**)).

The Agency has performed even worse when it comes to dextropropoxyphene + paracetamol combinations, which are far more popular than local antibiotics. It claims that these combinations, which are unnecessary, do not carry the same risks in France as in Sweden or the United Kingdom, where market withdrawal is planned for the end of 2005 (see page 20).

When drugs that have long been known to have negative risk-benefit balances, such as benfluorex and veralipride, are withdrawn from the Spanish market, the French Agency remains silent and sales continue unabated.

And when the drugs in question are new, expensive, and widely prescribed, the French agency not only allows them to remain on the market, but also ensures that information on the associated dangers is released very slowly. The slow release of information on adverse effects of the cox-2 inhibitors was but one example of this chronic failure to act.

In the near future, the French Agency will have to emerge from the shadows, and we will see where its true priorities lie!
