

Prescrire International translation procedures

Team work and strict quality control procedures

The translation process

Prescrire International is a bimonthly English-language journal containing translations of selected articles from the monthly French edition, *la revue Prescrire*. The international edition was created with two principal aims: first, to offer non French speakers access to *Prescrire's* systematic assessments of health technologies, and especially medicines; and second, to provide a platform for texts dealing with European and other international medicines policies.

The articles to be translated and the content of each issue of *Prescrire International* are chosen jointly by the editor-in-chief of *Prescrire International* and members of the editorial team of *la revue Prescrire*.

The texts are first prepared by a professional translation team, and are then thoroughly verified by a painstaking quality control procedure.

The translation team. The initial translations are prepared jointly by a British translator and the bilingual editor-in-chief of *Prescrire International*, who have both held their positions since the Journal was created in 1992.

The translation team also includes a bilingual editorial assistant responsible for the overall translation process; a British medical editor dealing with style matters; a French editor of *la revue Prescrire* who checks all the translations; the relevant authors and section editors, who approve the translations of their texts; and a British proofreader who checks the translations for typographic errors prior to publication.

The French texts are translated into English by the permanent translator, and checked for accuracy by the editor-in-chief of *Prescrire International*. Each translation is then sent to a British medical editor, who checks the style and looks for ambiguity and inconsistency. Her recommendations are taken into account by the editor-in-chief of *Prescrire International*, who deals with possible ambiguities and accepts or rejects the proposed changes.

The translation is then passed on to the editor with overall responsibility for the initial text, and to the relevant section editor of *la revue Prescrire*. It is also verified by the *Prescrire* desk editor. It is important to note that the responsible editor and section editor also check that the texts remain up to date. Indeed, several months can pass between the final literature update for the original article, publication of the French text, and its translation and publication in *Prescrire International*. Publication of new data can require the English translation to be modified or even cancelled. The date of publication in *la revue Prescrire* (given in the header of each article published in *Prescrire International*), and the date of the last literature update (given in the *Literature search* section at the end of each article) indicate the temporal validity of the English text.

The texts are then page-set by the production team of *Association Mieux Prescrire* (owner-publisher of *Prescrire International* and *la revue Prescrire*), under the responsibility of the editorial assistant. The consistency of the final layout is checked by the editor-in-chief of *Prescrire International*.

The proofs of the entire ►►

The situation is as worrying for originator drugs as for generics. And our long-term monitoring shows that no progress has been made over the years.

Given the apparent lack of reaction of the French medicines agency, and the lack of precise packaging quality standards in Europe, health professionals should report all packaging problems to the authorities and the companies concerned (with copy to *la revue Prescrire*).

Prescribers, pharmacists and nursing staff should also create quality groups, in order to share their experiences and to choose the drugs best adapted to each category of patients (6).

©PI

a- The *Prescrire* editorial team defines unit-dose blisters as those bearing on the back of each individual blister the INN, the dosage, the batch number and the expiry date. In 2003, examples of such blisters in France included *Thalidomide Laphal*[®] (thalidomide, see *Prescrire International* n° 67, p.165) and *Fluimucil*[®] effervescent tablets (acetylcysteine, see French edition n° 242, p. 587). Around 7% of blister packs examined in 2003 bore the INN and unit dose but not the batch number or the expiry date.

b- For patient-named delivery in hospitals, the pharmacy staff has to take all the tablets or capsules out of the blister packaging, and label those that are not properly labelled, individually for use on the ward.

c- The *Prescrire* editorial team consider that a unit-dose is in France identifiable when it bears the trade name or INN (printed or engraved). Good examples include *Advil*[®] 100 mg (ibuprofen, see French edition n° 238, p. 264) and *Zovirax*[®] 200 mg (aciclovir, see French edition n° 244, p. 736). Yet 70% of unit-doses studied in 2003 carried no label, and 30% only carried a manufacturing code.

d- In 2003 the *Prescrire* editorial team noticed a trend towards the use of fragile orally fast-dissolving tablets (*Zydys*[®]). These disintegrate almost immediately in mouth, without water, a property which can be helpful in some circumstances. The SPC for *Zyprexa Velotab*[®] (olanzapine, see French edition n° 239, p. 336), recommends that the tablets be kept in their blisters until use, and the blisters are thus individually labelled. This is not the case for *Imos-sellingual*[®] (loperamide, see French edition n° 245, p. 824).

e- Several factors can make the printing on a blister illegible, such as the use of small characters, poor colour choice, cramped information, shiny material. Poor examples in 2003 include the *Bacterix*[®] blister pack (nifuroxazide, see French edition n° 242, p. 586), on which the labelling is difficult to read and does not mention the INN (even though the trade name wrongly suggests antibiotic effects); and the poorly legible blister packs of *Ebixa*[®] (memantine, see *Prescrire International* n° 68, p. 203), a drug used for Alzheimer's disease.

f- In 2003, *Derogat*[®] oral solution (paroxetine, see French edition n° 237, p. 167-170) still has a dosing cup. They were given a *Prescrire Red Card* for this poor packaging in 2000 (*Prescrire International* n° 52, p. 35).

g- For example, glucagon is sold as a syringe prefilled with solvent + a vial of powder in a rigid box containing illustrated directions for use (*GlucaGen Kit*[®], see French edition n° 245, p. 824); *dobutamine* is sold in ready-to-use sachets (*Dobutamine Baxter*[®], see French edition n° 244, p. 739) (note, however, the poor choice of a sulfite preservative which can cause severe allergic reactions); and the new packaging of *Avonex*[®] in prefilled syringes (interferon beta-1a, see French edition n° 245, p. 814).

h- Examples include *Tubertest*[®] (tuberculin, see French edition n° 243, p. 665-666), and *Vistabel*[®] (type A botulinum toxin, see *Prescrire International* n° 67, p. 180).

ABOUT PRESCRIRE

► issue are scrutinised by the editor-in-chief of *Prescrire International*, who checks that the different comments have been taken into account, and then sends the proofs for verification by a British proofreader. The editor-in-chief of *la revue Prescrire* and the general director of *Association Mieux Prescrire* give their opinion on each issue. Finally, the publications director (President of *Association Mieux Prescrire*), who has over-all legal responsibility, gives the go-ahead for publication.

The translation process developed for *Prescrire International* is thus perfectly in line with the collective editorial procedures which have guaranteed the quality of our French edition over the years. The end result: faithful translations, correct English usage (including technical vocabulary), and a simple, concise style suited to an international readership.

ABOUT PRESCRIRE

Financial independence: the key to impartial continuing education

Only financial independence gives the freedom to act effectively. Thank you to *la revue Prescrire*'s 27,000 subscribers whose trust enables us to pursue and develop this collective enterprise.

"Thank you for maintaining your, and therefore our, freedom...", "The freer and more independent you are in your judgements, the stronger you will be in the current situation...", etc. The messages of support from subscribers to *la revue Prescrire* illustrate the obvious fact that only financial independence gives the freedom to act on the sole criterion of quality, and to carry out a health mission honestly.

It is only thanks to its total independence, made possible by its 27,000 subscribers and a determined, well-organised team, that *la revue Prescrire* is able to promote quality health care.

In the late 1970s, the founders of the journal made independence the essential condition of their project.

Financial independence vis-à-vis the pharmaceutical companies was a key condition from its inception. It took 12 years' work (from 1980 to 1991) to achieve total financial independence; i.e. to operate without a subsidy from the French government, relying solely on subscription revenue. Since 1992, much work has been required to maintain this total independence, as witnessed by the budget presented each year in the journal (see page opposite).

In order to have the freedom to act in the collective interest, it is essential to refuse all industry funding. This basic rule should apply both to individuals and to institutions, to state or quasi-public organisations, to health professionals (academic and hospital based), to patients and consumers (patients' associations, etc.).

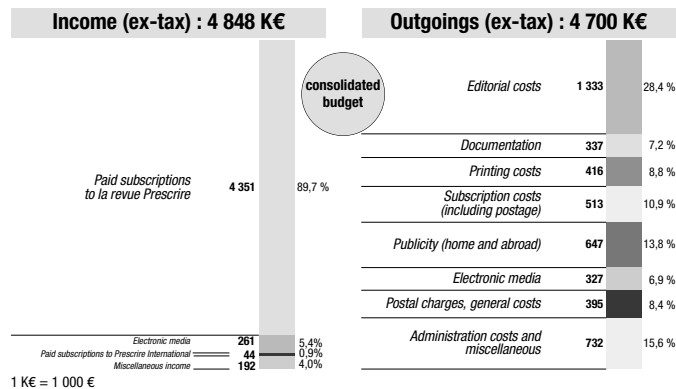

We must say now: NO THANK YOU..., I PREFER FREEDOM – the freedom to act in the best interests of patients.
